

ABS Basic

Standard safety harness for users working high up or doing maintenance work

A safety harness is an integral part of a personal fall protection kit (PPE) and a must when working at heights. Our ABS Basic safety harness guarantees you are always on the safe side.

Statutory German DGUV rule 112-198 describes the work environments where a safety harness should be used, for example whilst working on roofs, using vertical lifeline systems, mobile elevating work platforms etc.

Our ABS Basic is certified in accordance with EN 361:2002 and suitable for loads of up to 136 kg. It is equipped with 2 attachment points (1x chest, 1x back) to which the lanyard strap can be attached, enabling you to connect up to an existing anchorage device. The leg straps can be adjusted individually for a perfect fit to ensure maximum fall protection.

Our Sales & Engineering Team will be happy to help you select the perfect safety harness and provide you with further information, e.g. on our extremely comfortable-to-wear ABS Comfort safety harness.

- EN 361:2002
- 2 attachment points (1x chest, 1x back)
