

ABS TelePole

Telescopic rod - designed to easily access your carabiners

In halls, maintenance hangars and congress buildings, self-retracting fall protection lifelines (SRL) are often installed high-up in difficult (or impossible)-to-reach places. Use our ABS TelePole to simply pull the carabiner hook of the anchorage device over to you so that you can attach the safety harness of your protection equipment to it from a safe zone. This allows you to use an overhead rope-up protection system - and offers you maximum safety.

Our ABS TelePole telescopic rod has a hook at one end. This ABS Safety telescopic rod is extremely handy and easy to use. It is available in 3 extension lengths up to a maximum of 3 m, 4.5 m or 6 m, allowing you to easily reach a self-retracting lifeline attached to an anchorage point or lifeline system. If you need a different length, we can supply it upon request.

Of course, we also offer everything else you need for your personal fall protection kit (PPE). Our range of products includes high-quality ABS B-Lock self-retracting lifelines in a variety of different lengths, a selection of comfortable-to-wear safety harnesses and a broad collection of different connectors for virtually any application. Simply browse through our Fall arrest PPE section.

- Telescopic rod - makes light work of reaching the carabiner of a self-retracting lifeline installed overhead
- Three models to choose from: 3 m, 4.5 m and 6 m
- Other lengths available upon request
